CATWORLD / FOUR TRACING MAPS

US Letter landscape / R10 geography / 1 November 2026

Choose one print file

01_CLEAN_TRACING_LETTER.pdf: four pages with coastlines, rivers, lakes and terrain symbols, leaving the internal lettering to you. This is the main tracing master.

02_LABELLED_MAPS_LETTER.pdf: the same four sheets with working place names. Use it as your reference, or trace its lettering. Page order in both files: 1 birds, 2 cats, 3 reptiles, 4 whole world.

For only the full world, print individual/world_trace_Letter.pdf. It uses the same 360-degree rectangular projection as the satellite world map, centered on Panterra, with no cultural exclusions or plate-boundary overlays.

Every map sheet is 11 x 8.5 inches, landscape. Print at Actual size / 100%, black-and-white, single-sided. Disable borderless printing. Use normal quality to keep the fine strokes; draft mode can drop small marks.

The world is a 2:1 rectangle, approximately 10.3 x 5.15 inches on the sheet. White space above and below is intentional: filling the height would stretch the planet. Regional maps use more of the page height.

Optional larger drawing

04_ENLARGED_TRACING_TILED_LETTER.pdf enlarges each clean sheet to 180% across four Letter pages. Birds: pages 1-4. Cats: 5-8. Reptiles: 9-12. World: 13-16. Each assembled sheet is 19.8 x 15.3 inches.

Print the tiles at Actual size. Arrange 1A / 1B above 2A / 2B, match the repeated 10 mm artwork strips, trim one overlapping edge and tape from behind. Measure the 50 mm calibration bar before assembly. You do not need the tiles for ordinary Letter-size tracing.

Economical ink; editable artwork

All map artwork is black vector linework on white, without grey terrain or paper textures. Measured black-equivalent coverage: birds 1.77%, cats 1.74%, reptiles 1.57%, world 1.76%. This is rendered page coverage, not a cartridge-yield promise.

SVG linework and 300-dpi PNG sheets are included. The A4 file is optional. Begin tracing with shores and watercourses, then the mountain belts and woodland. Add lowland marks and your own names last. Titles, corner marks and notes are optional to trace.

FOUR POINTS OF VIEW

Birds / The Northern Reaches

The northern homeland occupies a broad continuous chart, from the Blood Lake to the mountain belt and southern plateau fringe. The cross marks the North Pole. Distant islands on both sides appear as thin, broken, partial outlines: these are islands of legend, not fully surveyed coasts.

Cats / The Lands of Panterra

Southern Panterra, the Seattle woodland and river, the reservoir valley, northern feeder and falls, eastern dam, cultivated hills and nearby islands are included. The facing mountain spines lead into a substantial western portion of the eastern continent, including its inner gulf. Australia and the distant southern route are absent.

Reptiles / The Eastern Realms

One continuous view crosses from eastern Panterra into the eastern homeland. A gentle 18-degree rotation keeps the connected mountain belt broad on the landscape sheet. The Panterran coast, downstream port and nearby merchant isle sit within the same projection and scale. These are explored approaches, not claims of political control.

Reptiles / Unexplored interior

Most of the eastern shoreline is uncharted and omitted. Its visible coast ends remain open; no enclosing border is drawn around the unknown land. Interior marks end with the survey. The same convention applies at the Panterran exploration frontier. Nearby known islands remain visible.

Whole world / Terra

The fourth sheet has no cultural limits. It includes Panterra, the eastern continent, the southern homeland, the sparse island route, Pelagic Crown, northern remnants and south polar land. It preserves the satellite map's equirectangular layout and central meridian of 0 degrees.

What the linework means

Coasts and lake outlines come from the R10 terrain fields; waterways come from the established hydrology paths. Regional sheets use Lambert azimuthal equal-area views. No coastline, continental arrangement or world model was redesigned for this pack.

Mountain signs summarize elevated terrain, not individual literal peaks. Trees indicate woodland; low arcs indicate hills; ripples indicate dry country; field outlines indicate cultivation. Small broken lines show ice. Rings mark settlements; open tower shapes mark gates and ruins. Paired strokes mark the dam or falls.

The exact knowledge frontiers are proposed story interpretations. Open coast ends mean uncharted continuation, not a new strait. Names such as Seattle, London, Rome and Milan remain working labels. No new regional rivers or capitals were invented. Fine coastal detail is generalized for a home printer.
